## REVIEW OF PRODUCT REPORT

To Whom It May Concern,

We have reviewed the ingredients in the Sniff 'n' Stop natural pest deterrent products and have concluded that the ingredients contained in each product match, both the active and inert ingredients printed on the packaging labels. According to EPA guidelines, these products qualify for exemption from registration under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Hula Consulting's team of recognized experts have over 20 years of experience working with regulatory agencies, including FDA, EPA, DOT, USDA, and OSHA, in ensuring that our clients meet all regulatory requirements. Additionally, our extensive knowledge of essential oils and aromas used in pest elimination and control, as well as in ingredient handling and labeling, attest to our qualifications.

Our team of experts analyzed each component for compliance, including ingredient suppliers' documentation, to validate our conclusion. We found that the product consists of the essential oils that are listed on the product label as the main active ingredients, and diatomaceous earth, also known as DE, and fullers earth as the main inert ingredients. A polymer resin is used to micro-encapsulate both the active and inert ingredients; the method of which is protected under a US patent 6,596,204.

I attest that the above details about the Sniff N Stop product are true and accurate based on the review conducted by the Hula Consulting team and its sub-contractors.
